

Package ‘REDCapR’

August 20, 2014

Title Interaction between R and REDCap

Description Encapsulates functions to streamline calls from R

Version 0.3-23

Date 2014-08-20

Author Will Beasley, David Bard, Thomas Wilson

Maintainer 'Will Beasley' <wibeasley@hotmail.com>

URL <http://ouhsc.edu/bbmc/>

Depends R(>= 3.0.0),stats

Imports httr,plyr,RCurl,stringr

Suggests devtools,knitr,methods,testit,testthat

| | |
|---------------|---|
| Account-class | <i>A Reference Class to represent a bank account.</i> |
|---------------|---|

Description

A Reference Class to represent a bank account.

Fields

balance1 A length-one numeric vector

balance2 A length-one numeric vector

Methods

withdraw1(x) Withdraw1 money from account. Allows overdrafts

withdraw2(x, longParameterName1, longParameterName2, longParameterName3, longParameterName4, longParameterName5) Withdraw2 money from account. Allows overdrafts

| | |
|-----------------------|--|
| create_batch_glossary | <i>Creates a data.frame that help batching long-running read and writes.</i> |
|-----------------------|--|

Description

The function returns a data.frame that other functions use to separate long-running read and write REDCap calls into multiple, smaller REDCap calls. The goal is to (1) reduce the chance of time-outs, and (2) introduce little breaks between batches so that the server isn't continually tied up.

Usage

```
create_batch_glossary(row_count, batch_size)
```

Arguments

row_count The number records in the large dataset, before it's split.

batch_size The maximum number of subject records a single batch should contain.

Details

This function can also assist splitting and saving a large data.frame to disk as smaller files (such as a .csv). The padded columns allow the OS to sort the batches/files in sequential order.

Value

Currently, a `data.frame` is returned with the following columns,

1. `id`: an integer that uniquely identifies the batch, starting at 1.
2. `start_index`: the index of the first row in the batch. integer.
3. `stop_index`: the index of the last row in the batch. integer.
4. `id_pretty`: a character representation of `id`, but padded with zeros.
5. `start_index`: a character representation of `start_index`, but padded with zeros.
6. `stop_index`: a character representation of `stop_index`, but padded with zeros.
7. `label`: a character concatenation of `id_pretty`, `start_index`, and `stop_index_pretty`.

Author(s)

See Also

See [redcap_read](#) for a function that uses `create_batch_glossary`.

Examples

```
library(REDCapR) #Load the package into the current R session.
create_batch_glossary(100, 50)
create_batch_glossary(100, 25)
create_batch_glossary(100, 3)
d <- data.frame(
  recordid = 1:100,
  iv = sample(x=4, size=100, replace=TRUE),
  dv = rnorm(n=100)
)
create_batch_glossary(nrow(d), batch_size=40)
```

REDCapR

REDCapR

Description

REDCapR

redcap_column_sanitize

Sanitize to adhere to REDCap character encoding requirements.

Description

Replace non-ASCII characters with legal characters that won't cause problems when writing to a REDCap project.

Usage

```
redcap_column_sanitize(d, column_names = colnames(d),
  encoding_initial = "latin1", substitution_character = "?")
```

Arguments

| | |
|------------------------|--|
| d | The data.frame containing the dataset used to update the REDCap project. Required. |
| column_names | An array of character values indicating the names of the variables to sanitize. Optional. |
| encoding_initial | An array of character values indicating the names of the variables to sanitize. Optional. |
| substitution_character | The character value that replaces characters that were unable to be appropriately matched. |

Details

Letters like an accented 'A' are replaced with a plain 'A'.

This is a thin wrapper around `base::iconv()`. The ASCII//TRANSLIT option does the actual transliteration work. As of R 3.1.0, the OSes use similar, but different, versions to convert the characters. Be aware of this in case you notice slight OS-dependent differences.

Value

A data.frame with same columns, but whose character values have been sanitized.

Author(s)

Will Beasley

Examples

```
# Examples are not shown because they require non-ASCII encoding,
# which makes the package documentation less portable.
```

| | |
|----------------|---|
| redcap_project | <i>A Reference Class to make later calls to REDCap more convenient.</i> |
|----------------|---|

Description

This Reference Class represents a REDCap project. Once some values are set that are specific to a REDCap project (such as the URI and token), later calls are less verbose (such as reading and writing data). The functionality

Fields

`redcap_uri` The URI (uniform resource identifier) of the REDCap project. Required.
`token` `token` The user-specific string that serves as the password for a project. Required.

Methods

`read(batch_size = 100L, interbatch_delay = 0, records = NULL, records_collapsed = NULL, fields = NULL)`
 Reads records in a REDCap project.

Examples

```
library(REDCapR) #Load the package into the current R session.
uri <- "https://bbmc.ouhsc.edu/redcap/api/"
token <- "9A81268476645C4E5F03428B8AC3AA7B"
project <- redcap_project$new(redcap_uri=uri, token=token)
dsAll <- project$read()

#Demonstrate how repeated calls are more concise when the token and url aren't always passed.
dsThreeColumns <- project$read(fields=c("record_id", "sex", "age"))$data

idsOfMales <- dsThreeColumns[dsThreeColumns$sex=="M", "record_id"]
idsOfMinors <- dsThreeColumns[dsThreeColumns$age < 18, "record_id"]

dsMales <- project$read(records=idsOfMales, batch_size=2)$data
dsMinors <- project$read(records=idsOfMinors)$data
```

| | |
|-------------|---|
| redcap_read | <i>Read records from a REDCap project in subsets, and stacks them together before returning a data.frame.</i> |
|-------------|---|

Description

From an external perspective, this function is similar to [redcap_read_oneshot](#). The internals differ in that `redcap_read` retrieves subsets of the data, and then combines them before returning (among other objects) a single `data.frame`. This function can be more appropriate than [redcap_read_oneshot](#) when returning large datasets that could tie up the server.

Usage

```
redcap_read(batch_size = 100L, interbatch_delay = 0, redcap_uri, token,
  records = NULL, records_collapsed = NULL, fields = NULL,
  fields_collapsed = NULL, export_data_access_groups = FALSE,
  raw_or_label = "raw", verbose = TRUE, cert_location = NULL,
  id_position = 1L)
```

Arguments

| | |
|--|---|
| <code>batch_size</code> | The maximum number of subject records a single batch should contain. The default is 100. |
| <code>interbatch_delay</code> | The number of seconds the function will wait before requesting a new subset from REDCap. The default is 0.5 seconds. |
| <code>redcap_uri</code> | The URI (uniform resource identifier) of the REDCap project. Required. |
| <code>token</code> | The user-specific string that serves as the password for a project. Required. |
| <code>records</code> | An array, where each element corresponds to the ID of a desired record. Optional. |
| <code>records_collapsed</code> | A single string, where the desired ID values are separated by commas. Optional. |
| <code>fields</code> | An array, where each element corresponds a desired project field. Optional. |
| <code>fields_collapsed</code> | A single string, where the desired field names are separated by commas. Optional. |
| <code>export_data_access_groups</code> | A boolean value that specifies whether or not to export the “redcap_data_access_group” field when data access groups are utilized in the project. Default is FALSE. See the details below. |
| <code>raw_or_label</code> | A string (either 'raw' or 'label' that specifies whether to export the raw coded values or the labels for the options of multiple choice fields. Default is 'raw'. |
| <code>verbose</code> | A boolean value indicating if messages should be printed to the R console during the operation. Optional. |
| <code>cert_location</code> | If present, this string should point to the location of the cert files required for SSL verification. If the value is missing or NULL, the server’s identity will be verified using a recent CA bundle from the cURL website . See the details below. Optional. |
| <code>id_position</code> | The column position of the variable that unique identifies the subject. This defaults to the first variable in the dataset. |

Details

Specifically, it internally uses multiple calls to [redcap_read_oneshot](#) to select and return data. Initially, only primary key is queried through the REDCap API. The long list is then subsetting into partitions, whose sizes are determined by the `batch_size` parameter. REDCap is then queried for all variables of the subset’s subjects. This is repeated for each subset, before returning a unified `data.frame`.

The function allows a delay between calls, which allows the server to attend to other users’ requests.

Value

Currently, a list is returned with the following elements,

1. data: An R data.frame of the desired records and columns.
2. success: A boolean value indicating if the operation was apparently successful.
3. status_codes: A collection of [http status codes](#), separated by semicolons.
4. outcome_messages: A collection of human readable strings indicating the operations' semi-colons
5. records_collapsed: The desired records IDs, collapsed into a single string, separated by commas.
6. fields_collapsed: The desired field names, collapsed into a single string, separated by commas.
7. elapsed_seconds: The duration of the function.

A user account is required to access the wiki, which typically is granted only to REDCap administrators. If you do not

The official [cURL site](#) discusses the process of using SSL to verify the server being connected to.

Examples

```
## Not run:
library(REDCapR) #Load the package into the current R session.
uri <- "https://bbmc.ouhsc.edu/redcap/api/"
token <- "9A81268476645C4E5F03428B8AC3AA7B"
redcap_read(batch_size=2, redcap_uri=uri, token=token)

## End(Not run)
```

| | |
|---------------------|--|
| redcap_read_oneshot | <i>Read records from a REDCap project.</i> |
|---------------------|--|

Description

This function uses REDCap's [API](#) to select and return data.

Usage

```
redcap_read_oneshot(redcap_uri, token, records = NULL,
  records_collapsed = NULL, fields = NULL, fields_collapsed = NULL,
  export_data_access_groups = FALSE, raw_or_label = "raw", verbose = TRUE,
  cert_location = NULL)
```

Arguments

| | |
|---------------------------|---|
| redcap_uri | The URI (uniform resource identifier) of the REDCap project. Required. |
| token | The user-specific string that serves as the password for a project. Required. |
| records | An array, where each element corresponds to the ID of a desired record. Optional. |
| records_collapsed | A single string, where the desired ID values are separated by commas. Optional. |
| fields | An array, where each element corresponds a desired project field. Optional. |
| fields_collapsed | A single string, where the desired field names are separated by commas. Optional. |
| export_data_access_groups | A boolean value that specifies whether or not to export the “redcap_data_access_group” field when data access groups are utilized in the project. Default is FALSE. See the details below. |
| raw_or_label | A string (either 'raw' or 'label' that specifies whether to export the raw coded values or the labels for the options of multiple choice fields. Default is 'raw'. |
| verbose | A boolean value indicating if messages should be printed to the R console during the operation. Optional. |
| cert_location | If present, this string should point to the location of the cert files required for SSL verification. If the value is missing or NULL, the server’s identity will be verified using a recent CA bundle from the cURL website . See the details below. Optional. |

Details

I like how **PyCap** creates a ‘project’ object with methods that read and write from REDCap. However this isn’t a style that R clients typically use. I like the logic that it’s associated with a particular REDCap project that shouldn’t change between calls. As a compromise, I think I’ll wrap the uri, token, and cert location into a single S4 object that’s passed to these methods. It will make these calls take less space.

The ‘REDCapR’ package includes a recent version of the [Bundle of CA Root Certificates](#) from the official [cURL site](#). This version is used by default, unless the ‘cert_location’ parameter is given another location.

If you do not pass in this export_data_access_groups value, it will default to FALSE. The following is from the API help page for version 5.2.3: This flag is only viable if the user whose token is being used to make the API request is **not** in a data access group. If the user is in a group, then this flag will revert to its default value.

Value

Currently, a list is returned with the following elements,

1. data: An R data.frame of the desired records and columns.
2. success: A boolean value indicating if the operation was apparently successful.
3. status_code: The [http status code](#) of the operation.
4. outcome_message: A human readable string indicating the operation’s outcome.
5. records_collapsed: The desired records IDs, collapsed into a single string, separated by commas.

6. `fields_collapsed`: The desired field names, collapsed into a single string, separated by commas.
7. `elapsed_seconds`: The duration of the function.
8. `raw_text`: If an operation is NOT successful, the text returned by REDCap. If an operation is successful, the 'raw_text' is returned as an empty string to save RAM.

The official documentation can be found on the 'API Examples' page on the REDCap wiki (<https://iug.devguard.com/trac/redcap/wiki/ApiExamples>). A user account is required.

The official [cURL site](#) discusses the process of using SSL to verify the server being connected to.

Examples

```
## Not run:
library(REDCapR) #Load the package into the current R session.
uri <- "https://bbmc.ouhsc.edu/redcap/api/"
token <- "9A81268476645C4E5F03428B8AC3AA7B"
#Return all records and all variables.
ds_all_rows_all_fields <- redcap_read_oneshot(redcap_uri=uri, token=token)$data

#Return only records with IDs of 1 and 3
desired_records_v1 <- c(1, 3)
ds_some_rows_v1 <- redcap_read_oneshot(
  redcap_uri=uri,
  token=token,
  records=desired_records_v1
)$data

#Return only the fields recordid, first_name, and age
desired_fields_v1 <- c("recordid", "first_name", "age")
ds_some_fields_v1 <- redcap_read_oneshot(
  redcap_uri=uri,
  token=token,
  fields=desired_fields_v1
)$data

## End(Not run)
```

`validate_for_write`

Inspect a data.frame to anticipate problems before writing to a REDCap project.

Description

This set of functions inspect a `data.frame` to anticipate problems before writing with REDCap's [API](#).

Usage

```
validate_for_write( d )  
  
validate_no_logical( d )  
  
validate_no_uppercase( d )
```

Arguments

| | |
|---|--|
| d | The data.frame containing the dataset used to update the REDCap project. Required. |
|---|--|

Details

All functions listed in the Usage section above inspect a specific aspect of the dataset. The `validate_for_read()` function executes all these individual validation checks. It allows the client to check everything with one call.

Value

A data.frame, where each potential violation is a row. The two columns are:

1. `field_name`: The name of the data.frame that might cause problems during the upload.
2. `field_index`: The position of the field. (For example, a value of '1' indicates the first column, while a '3' indicates the third column.)
3. `concern`: A description of the problem potentially caused by the field.
4. `suggestion`: A *potential* solution to the concern.

Author(s)

Will Beasley

Examples

```
d <- data.frame(  
  recordid = 1:4,  
  flag_logical = c(TRUE, TRUE, FALSE, TRUE),  
  flag_Uppercase = c(4, 6, 8, 2)  
)  
validate_for_write(d = d)
```
